

Jarvis-Max

a beginner's notebook

for curious newbies of AI & GitHub · by Dr Wolf & Claude

Hi, curious one!

Jarvis-Max is a voice assistant for your Windows PC. You talk, he answers out loud. If you let him, he can also use your mouse & keyboard, read the web, keep notes about you, and learn from his mistakes every night. It's free and open for everyone (AGPL-3.0).

Words you'll meet

- ✎ **AI brain** = the model that does the thinking (Claude, Gemini or Qwen).
- ✎ **GitHub** = a website where people share code for free.
- ✎ **Repo** = one project's folder on GitHub (this one is Jarvis-Max).
- ✎ **Download ZIP** = copy the whole repo to your PC in one file.
- ✎ **.bat file** = a "double-click to start" file on Windows.
- ✎ **API key** = a secret code that lets an app use an AI service. Treat it like a password. Never share it.
- ✎ **Ollama** = a free app that runs an AI on your own PC, no internet brain needed.
- ✎ **Black window** = Jarvis's engine. Leave it open while he works.

What you need

- ☐ Windows 10 or 11 (64-bit)
- ☐ A microphone (a webcam is optional)
- ☐ Internet for the first start (it downloads about 2.5 GB in total)
- ☐ At least one brain:
 - **Claude plan**: paid, the smartest. You just sign in once.
 - **Gemini key**: free at aistudio.google.com/apikey (small limits per minute).
 - **Ollama + qwen3.5:9b**: free & private, needs a good graphics card.

Not a fake!

He doesn't just talk with a pretty face. He **does** things on your PC, and asks you first before anything risky.

turn the page →

Let's go! 7 steps

- 1 Go to github.com/Sh4nkR/Jarvis-Max. Click the green **Code** button → **Download ZIP**.
- 2 Right-click the ZIP → **Extract All**. Put the folder on your Desktop.
- 3 Open the folder. Double-click **Start-Jarvis-Max.bat**.
Windows says "protected your PC"? → **More info** → **Run anyway**.
- 4 The first start is slow (it downloads his parts). A Claude page opens: **sign in** → **Authorize**.
No Claude plan? Close it, click **BRAIN** → **Gemini** and paste your free key.
- 5 The window asks for the microphone. Click **Allow**.
- 6 Press **TALK** (or F2), say "hello", press it again. He answers! 🎉
- 7 Make him yours: open **app\jarvis.json** in Notepad and set **"call_me": "Your Name"**.
Save, then start him again.

Safety first

- ✎ **HANDS** button OFF = he may look, but not touch.
- ✎ Slam the mouse into **any screen corner** = emergency stop for his hands.
- ✎ **STOP** or **Esc** stops him mid-sentence or mid-task.
- ✎ An **ALLOW / DENY** box shows up before anything risky. Read it, then decide.
- ✎ Your keys stay in the **secrets** folder, which never goes to GitHub.

Things to say

"what's on my screen?" · "research the best budget phone" · "remember my car is white" ·
"switch to Gemini". 👍 / 👎 after an answer teaches him.

Your first GitHub moves

- ★ **Star** = bookmark it & say thanks
- 📋 **Fork** = your own copy to play with
- 🐛 **Issues** = report a bug or ask
- 🔄 **Pull request** = offer your fix back

Stuck?

READ-ME-FIRST.txt = every button
logs\jarvis.log = what went wrong
Jarvis-Max.md = the full manual
TANTRA-03 = phone hands (Android)
